

ASSIGNMENT

#

01

SUBMITTED BY: AREEBA KHAN

SUBMITTED TO: SIR MUKHTIAR ZAMIN

REG NO : FA22-BSE-008

SUBJECT : BUSINESS PROCESS

ENGINEERING

DATED: 18th APRIL, 2026

DEPARTMENT OF SOFTWARE

ENGINEERING

EXERCISE # 1.6

1. Which type of process is the above one: order-to-cash, procure-to-pay or issue-to-resolution?

The process is an order-to-cash process because the customer submits a prescription, the pharmacy processes it, and the customer receives the medicine and pays any remaining cost.

2. Who are the actors in this process?

The actors in this process are

- customers
- pharmacy technicians
- pharmacists
- doctors
- insurance companies
- Pharmacy System.

3. What value does the process deliver to its customer(s)?

The process delivers safe and verified medication to customers, ensures drug safety through automated and manual checks and reduces cost through insurance coverage.

4. What are the possible outcomes of this process?

The possible outcomes are that the prescription is fully approved and dispensed, partially approved with co-payment, rejected due to safety or insurance issues, or modified after pharmacist or doctor review.

5. Taking the perspective of the customer, what performance measures can be attached to this process?

From the customer's perspective, performance measures include waiting time, total processing time, accuracy of medication, cost paid by the customer and reliability of receiving prescription on time.

6. What potential issues do you foresee this process might have? What information would you need to collect in order to analyze these issues?

The process may have issues such as long waiting times, hourly processing delays, bottlenecks at pharmacists, complex insurance rules and delays due to doctor confirmation. To analyze these issues, data such as processing time at each stage, workload per hour, queue length, DUR alert frequency, insurance rejection rates and peak time demand is needed.

7. What possible changes do you think could be made to this process in order to address the above issues?

The process can be improved by introducing real time or smaller batch processing instead of hourly grouping, using electronic prescriptions, automating insurance and drug interaction checks, reducing manual data entry, and improving notification and scheduling systems for customers.

EXERCISE # 1.7

1. What type of process?

The process is a procure-to-pay process because it starts from a purchase request and ends with payment to the vendor after receiving goods and invoices.

2. Who are the actors in this process?

Who is the customer?

The actors include employees, supervisors, the Purchasing Department, vendors, Goods Receipt Department, Accounts Payable office, and the bank system. The customers are the employees who request the goods internally within a company.

3. What value does the process deliver to its customer(s)?

The process delivers required goods or services to employees in the organization by ensuring approved purchasing, proper vendor selection, delivery notification and final payment processing.

4. What are the possible outcomes of this process?

The possible outcomes are successful procurement and delivery of goods, rejection of purchase requests, delayed purchases due to approval or processing issues, returned goods due to quality problems, or failed payments due to banking or data errors.

5. Taking the perspective of the customer, what performance measures can be attached to this process?

From the customer's perspective, performance measures include total procurement time, approval time, delivery time, accuracy of order fulfilment, cost efficiency and reliability of receiving goods on time.

6. What potential issues do you foresee this process might have? What info would you need to collect in order to analyze these issues?

The process may face issues such as long approval delays, paper-based inefficiency

data entry errors, expired quotes, supplier mismatches, slow three-way matching, and payment failures. To analyze these issues, data such as approval cycle time, error rates, number of rejected requests, invoice discrepancies, payment delays and vendor response time is needed.

7. What possible changes do you think could be made to this process in order to address above issues?

The process can be improved by digitizing purchase requests, using an automated workflow systems for approvals, integrating accounting and enterprise systems, maintaining real-time vendor databases, reducing paper based communication, and automating three-way matching and payment verification.
